A Results across gene–network pairs (n = 47)
Moderate = 0
Strong • 1
Limited • 3
No direct public match • 23
Needs different data • 20
Each unit is one gene in one network; a gene may appear in more than one network.
B Genes with public genetic evidence
APOE
Astrocytes
STRONG GENETIC SUPPORT
rs429358 • top candidate AD variant (score 1.0) • AD P ≈ 1.88 × 10^−155
Brain-tissue support; an exact astrocyte match was not available
COX7C
Astrocytes + inhibitory neurons
LIMITED GENETIC SUPPORT
rs2010322 • brain RNA-splicing link (source confidence level 5) • AD P ≈ 2.64 × 10^−6
The same source result appears in two networks; it is not two separate confirmations
SELENOW
Excitatory neurons
LIMITED GENETIC SUPPORT
Listed in a study linking predicted gene activity to AD (TWAS)
The public table lacks the test score and exact neuron type
C Genes without a clear result
NO DIRECT MATCH IN THE PUBLIC DATA SEARCH
16 non-mitochondrial genes • 23 gene–network pairs
ANKRD11
ATP6V1F
COX4I1
COX6B1
DYNLT1
FTL
LAMTOR5
LAPTM4A
NCOA1
RPL11
RPL15
RPL38
RPLP1
RPS13
RPS15
UQCR10
MITOCHONDRIAL GENES NEED DIFFERENT DATA
6 mitochondrial-DNA genes • 20 gene–network pairs
MT-ATP6
MT-CO2
MT-CO3
MT-CYB
MT-ND4
MT-ND5
Needs mitochondrial-DNA measurements and special quality checks.
No public match ≠ no genetic role • Missing data ≠ negative result
Categories show what the public data search could test; they do not measure cause.
