

APOE-centered astrocyte consensus network

U1-U2 nodes are upstream context; D1-D2 nodes lie downstream; arrows follow the Bayesian-network direction

HOW TO READ

Gene + x/4 = neighborhood occurrence

U1/U2 = upstream distance to APOE

○ Query hit observed in ≥ 1 of 4 runs

→ Bayesian-network direction

Larger node = seen in more supporting run-specific neighborhoods

NODE FILL: DIRECT DEG

- AD-up only
- AD-down only
- Both directions
- No stored direct DEG

PATHWAY OUTLINE

Contextual annotations; none has BH FDR < 0.05

○ Amyloid fiber formation
n=3; FDR=0.167

○ Cholesterol transport / efflux
n=2; FDR=0.9

○ Cristae formation
n=2; FDR=0.9

DISPLAY SCOPE

19 nodes / 18 edges
All 2 incoming + 11 outgoing APOE edges
D2 paths to all 7 observed query hits
