

Phase 18 key-driver selection

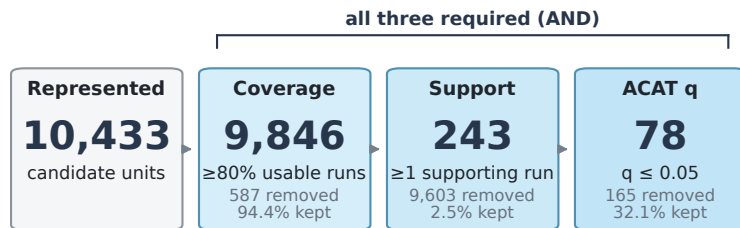

From 95,557 run-level tests to 47 displayed gene × network positions

A Starting evidence and aggregation

The counting unit changes; box sizes are not proportional.

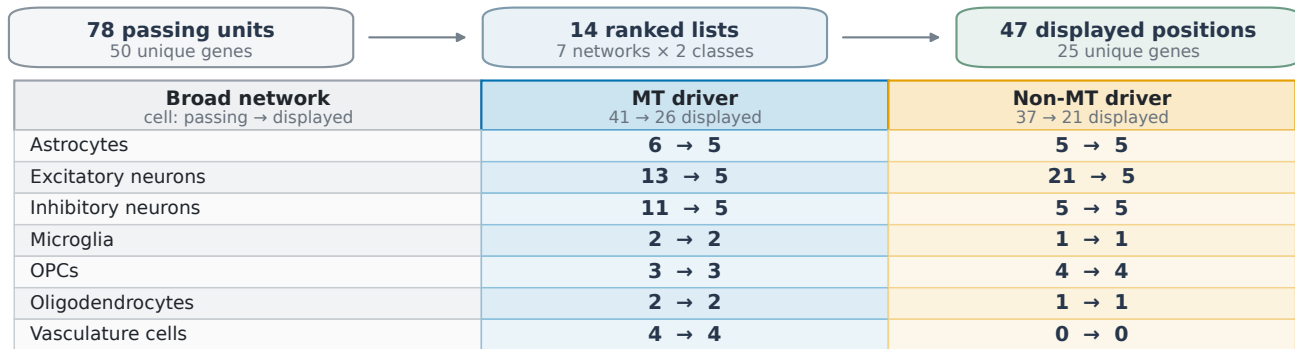

B All three candidate gates are required

Counts are conditional in the displayed order.
The final decision is the intersection of all three gates.

78 passing units = 0.75% of the represented candidate units

C Rank within each network and driver class; retain up to five

Rank by aggregate ACAT q, then ACAT p, then gene symbol • retain ranks 1-5 • no backfilling
