

Phase 18 key-driver attrition across five filters

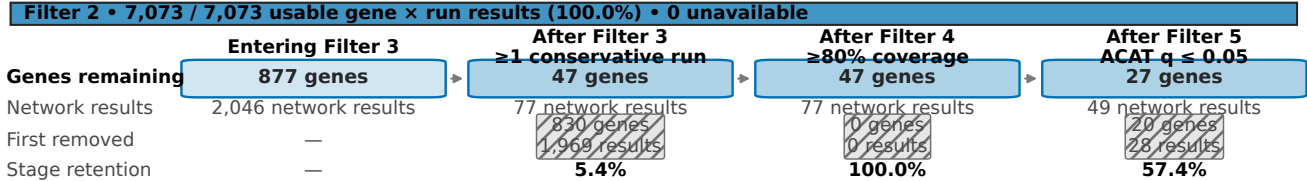

Exact validated counts • three cases remain separate • native counting unit shown at every stage

A Shared run scope and the three counting units

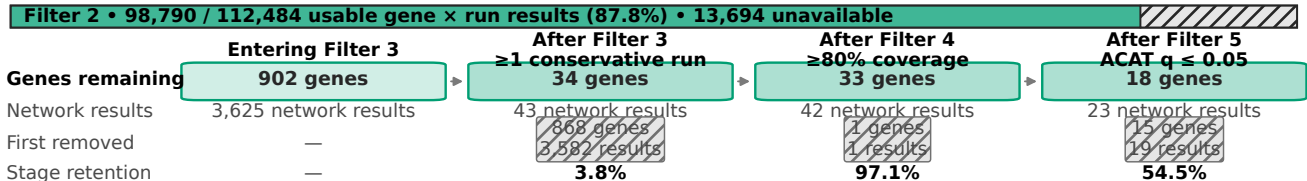

B Case 1 — MT-related and in query

(self-overlap removed)

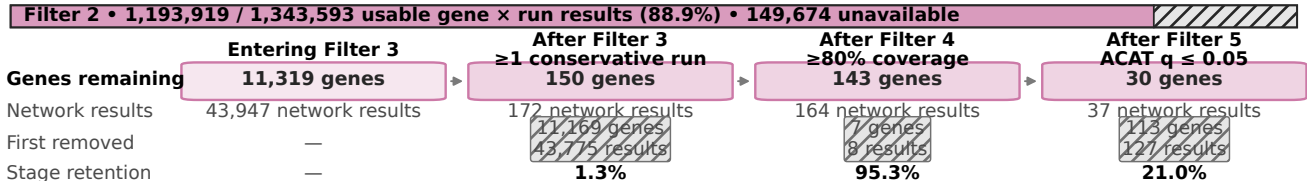

C Case 2 — MT-related and not in query

(query-independent mitochondrial gene)

D Case 3 — Outside core MitoCarta

(not one of the 1,136 core genes)

Large type: distinct genes retained in ≥1 broad network. Smaller type: gene-network-case results.
Filter 2 counts gene × run opportunities. Counts are exact; no formal case comparison was performed.
