

Sex- and APOE-stratified support for Case 3 key-driver candidates

Primary AD-up and AD-down mitochondrial queries • descriptive strata, not interaction tests

15 circle genes • 21 circle-displayed contexts • 22 total passing contexts • 264 cells

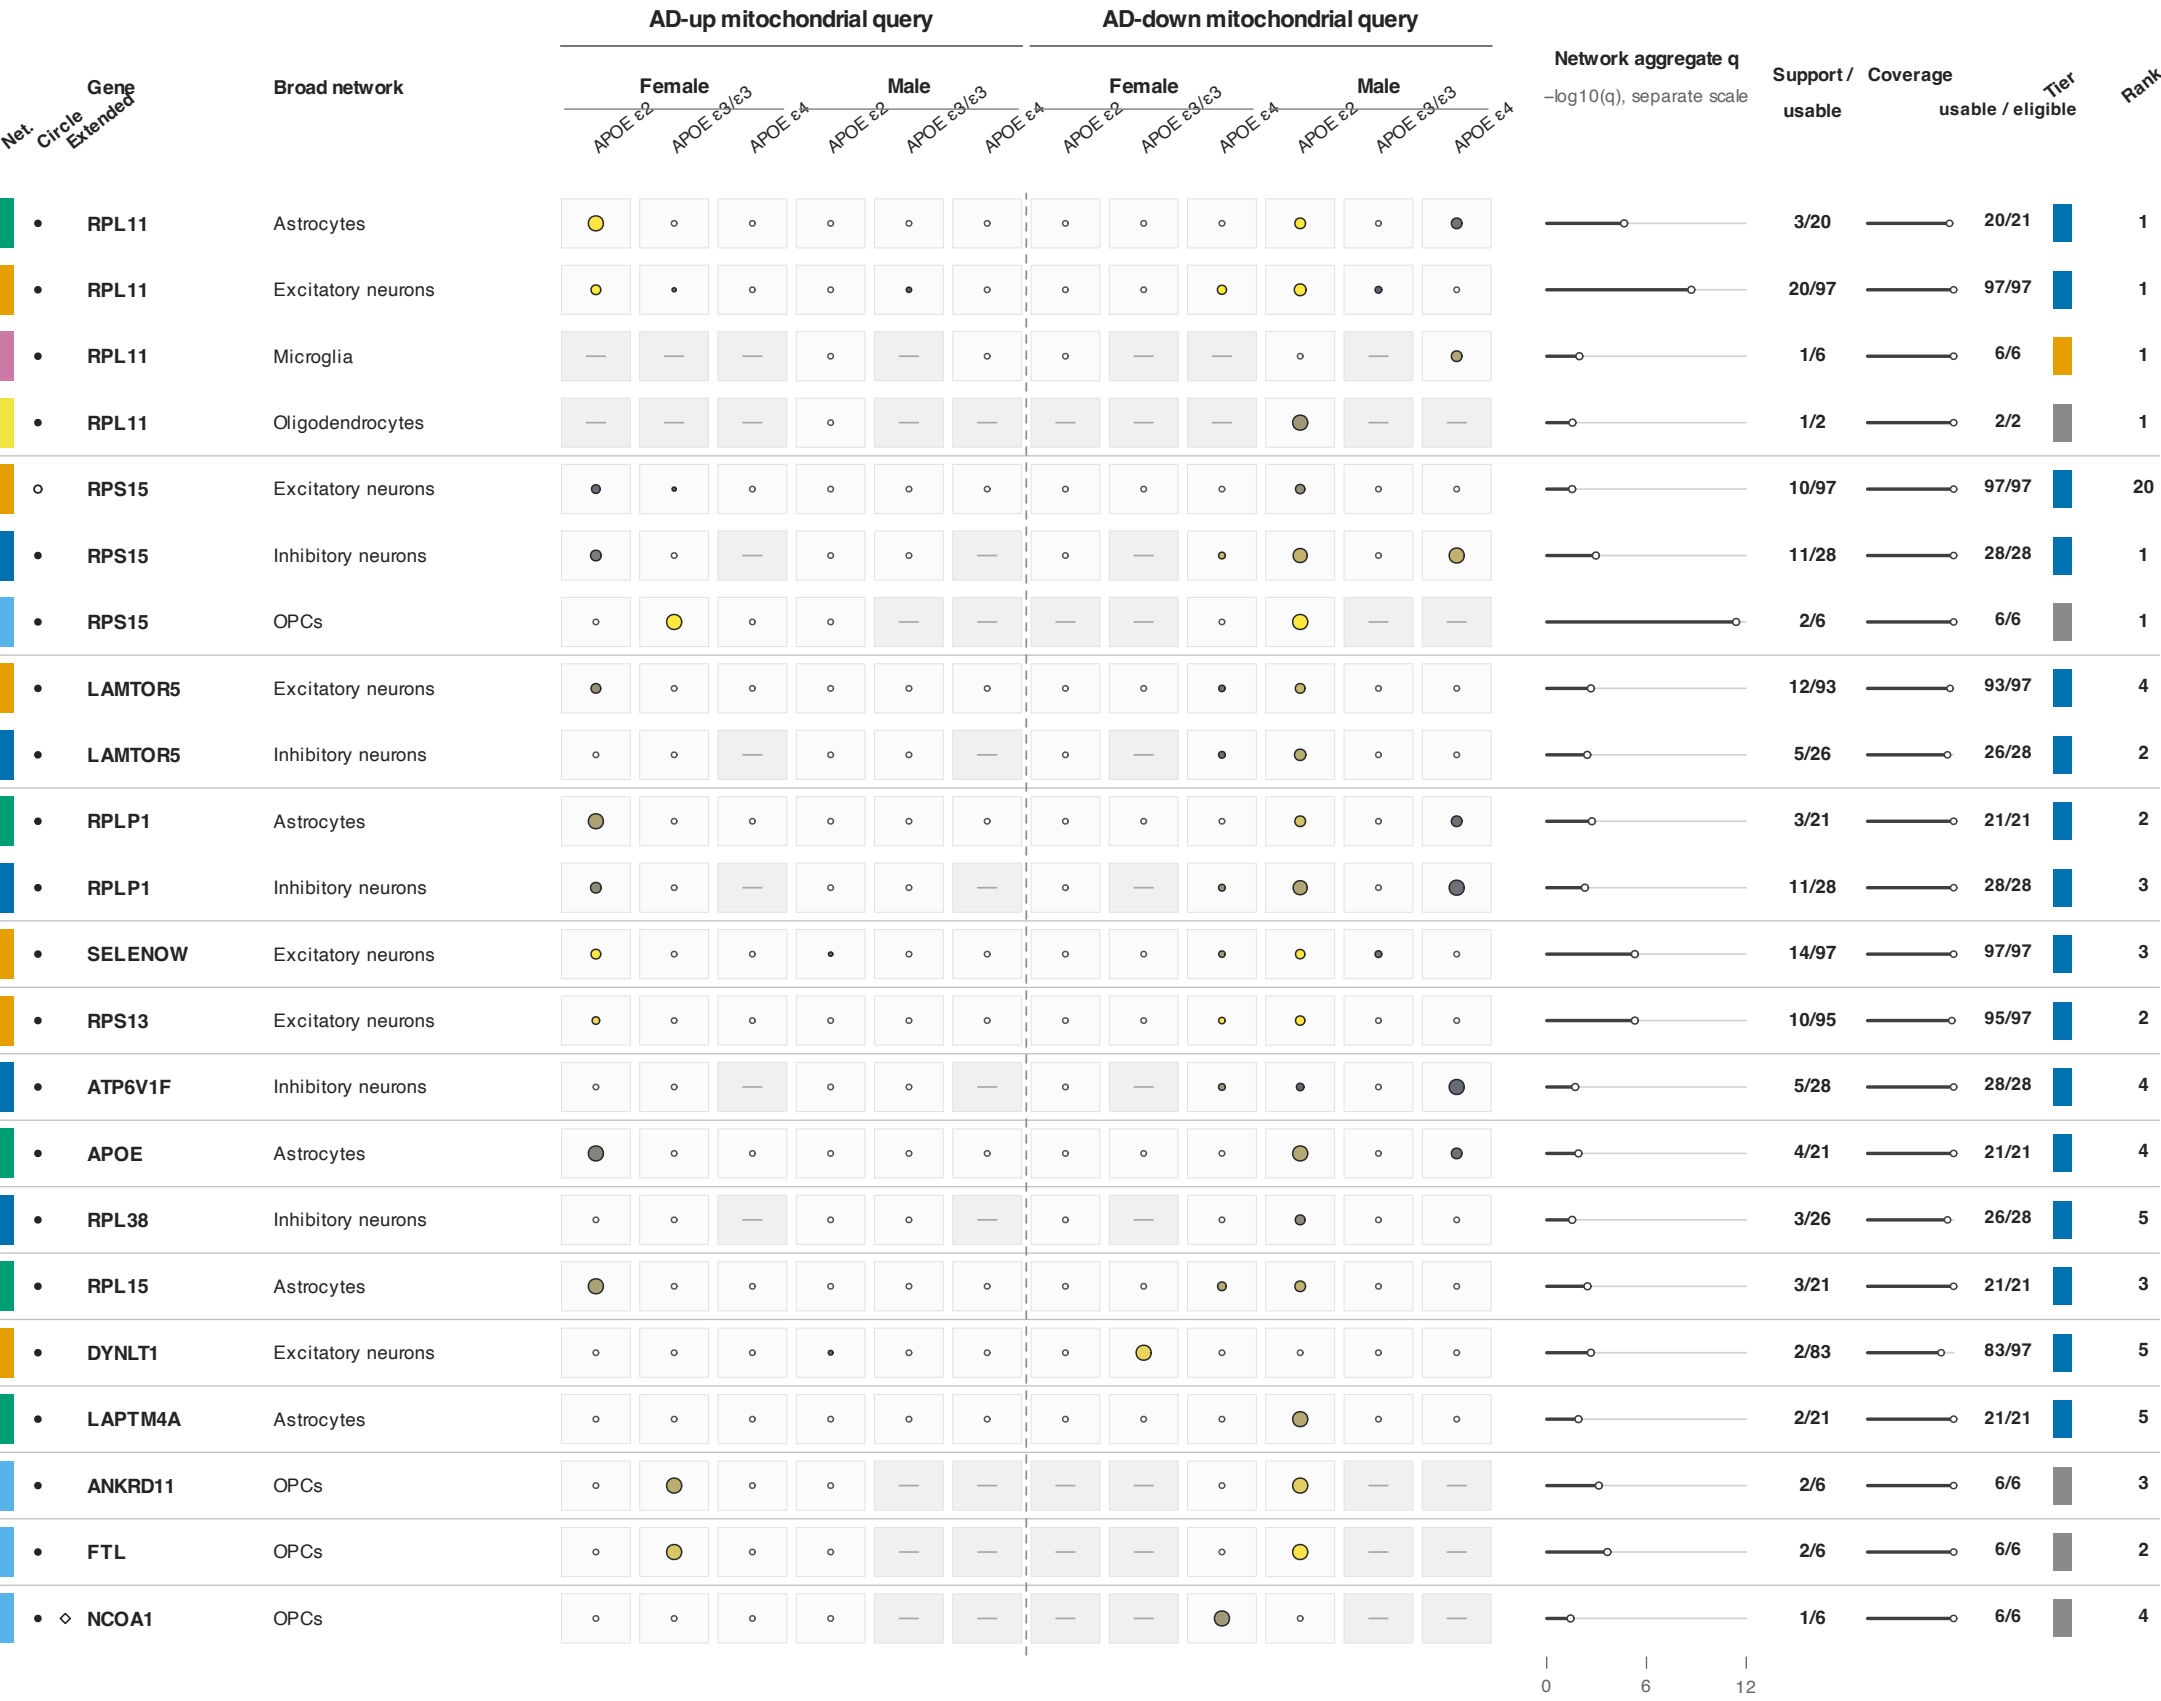

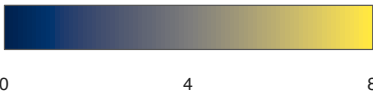

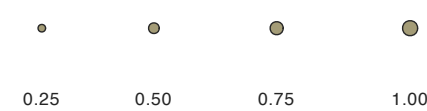

Figure keys

Stratum ACAT evidence

capped -log10(stratum ACAT P)

Supporting-dot area

fraction of usable queries supporting

Cell states

- supporting tested
- tested, zero support
- eligible, no usable test
- no eligible query

Row annotations

- circle-displayed context
- passing context below display cap
- broader mitochondrial reference

Network strip

- Astrocytes
- Excitatory neurons
- Inhibitory neurons
- Microglia
- OPCs
- Oligodendrocytes
- Vasculature

Evidence tier

- Tier 1: recurrent/stable
- Tier 2: localized/unstable
- Tier not assessable

Neutral right-side points show network q, not stratum P.

Shapes and direct labels preserve meaning without color.

Each cell aggregates eligible fine-cell-type queries within one fixed broad Bayesian network.

Case 3 denotes genes outside core MitoCarta; network key-driver evidence prioritizes candidates but does not prove causality.
